A. Research workflow
1 Define the research comparison
Intervention, outcome, scope of claims
2 Specify agents and network
Roles, initial beliefs, graph, update rules
3 Check a local baseline
Seeded runs and a readable event trace
4 Add role-conditioned language
Bound prompts; inspect returned messages
5 Separate the decision tier
Probability rules or LLM judgments
6 Evaluate and refine
Behavior, activity, sensitivity, time, cost
revise
B. LAND interaction loop
Agent state + network at step t
Controller supplies the available context
Judge whether the actor speaks
A closed gate produces no new message
Author a message if the gate opens
Generative tier: role + bounded context
Judge sharing and route exposures
Targets / neighbors; attention / persuasion
Accumulate exposure scores
Signed effects of accepted exposures
Commit state + write the event log
Advance to step t + 1
next step
